

# Modern Statistical Inference Methods

## Spring 2026

**Instructor:** Xintao Xia (xintaox@zju.edu.cn)

**Lecture:** Tuesdays, 10:00–12:25

### 1 Course Overview

This course develops a unified inference toolkit for real-world data where the data-collection mechanism is nontrivial: **survey sampling**, **missing data**, and **causal inference**. A recurring theme is that valid inference requires explicit reasoning about the *mechanism*—sampling design, non-response/missingness, or treatment assignment—and that modern methods (IPW, doubly robust estimators, semiparametric efficiency, ML-assisted inference) can be understood within a common framework. To motivate these ideas, we take a *historical perspective*, tracing how *classical problems and early debates* in statistics led to today’s emphasis on *valid inference, efficiency, and robustness*, and using these milestones to cultivate *statistical thinking*.

### 2 Prerequisites

- Probability and mathematical statistics (LLN/CLT, basic likelihood theory)
- Linear regression and matrix algebra
- Asymptotic statistics (optional, but recommended)
- An open mind and a willingness to think critically, participate actively, and share ideas

### 3 Learning Objectives

By the end of the course, students will be able to:

1. Conduct design-based inference under common survey designs (SRS, stratified, cluster, PPS).
2. Construct variance estimators for complex surveys (linearization and replicate-weight methods).
3. Diagnose and handle missing data under MCAR/MAR/MNAR; implement EM and multiple imputation.
4. Estimate causal effects under potential outcomes and (optionally) graphical perspectives.
5. Implement propensity-score methods, IPW, AIPW/DR.
6. Use ML for nuisance estimation while maintaining valid inference (sample-splitting / cross-fitting).

## 4 Recommended References

### Survey sampling

- Ding Peng, *A First Course in Causal Inference*
- Judea Pearl, *Causality*

## 5 Course Grades

- Homework (7 total): **70%**
- Final presentation: **30%**

**Homework:** Assigned every two weeks; each set contains 3–5 problems.

**Final presentation:** Each student (or team) will deliver a short presentation on a paper related to survey sampling, missing data, or causal inference. The presentation should clearly state the problem formulation, summarize the paper’s main contributions, and highlight the key ideas and insights.

## 6 Tentative Schedule

Wk	Contents
1	<ul style="list-style-type: none"><li>• Course roadmap; <i>what is statistics</i> and <i>what is statistical inference</i>; data-collection mechanisms as first-class objects (design / missingness / assignment).</li><li>• Review: LLN/CLT, the delta method, and the intuition behind weighting.</li></ul>
2	<ul style="list-style-type: none"><li>• Survey sampling I: finite-population inference; SRSWOR/SRSWR.</li><li>• Horvitz–Thompson estimator; variance under SRS; confidence intervals.</li></ul>

Wk	Contents
3	<ul style="list-style-type: none"> <li>• Survey sampling II: unequal-probability designs and PPS sampling.</li> <li>• Stratified and cluster sampling: allocation and efficiency; design effects; two-stage designs.</li> </ul>
4	<ul style="list-style-type: none"> <li>• Survey sampling III: Estimation under complex designs.</li> <li>• Ratio estimators and regression/GREG; design-based vs. model-assisted perspectives.</li> <li>• Variance estimation: Taylor linearization and an influence-function viewpoint.</li> </ul>
5	<ul style="list-style-type: none"> <li>• Survey sampling IV: practical issues and advanced topics; introduction to nonresponse.</li> <li>• Nonresponse adjustment: unit vs. item nonresponse; response mechanisms and bias.</li> <li>• Post-stratification and calibration weighting; response propensity modeling.</li> </ul>
6	<ul style="list-style-type: none"> <li>• Missing data I: MCAR/MAR/MNAR; observed-data likelihood.</li> <li>• Identifiability under MAR; hypothesis testing.</li> </ul>
7	<ul style="list-style-type: none"> <li>• Missing data II: likelihood-based inference for incomplete data.</li> <li>• EM algorithm; selection vs. pattern-mixture models.</li> </ul>
8	<ul style="list-style-type: none"> <li>• Missing data III: multiple imputation (MI) and Rubin's rules.</li> <li>• Practical imputation strategies and post-imputation analysis.</li> </ul>
9	<ul style="list-style-type: none"> <li>• Missing data IV: IPW under MAR; augmented IPW and doubly robust estimation.</li> <li>• Cross-fitting intuition and why overfitting can invalidate inference.</li> </ul>
10	<ul style="list-style-type: none"> <li>• Missing data V: Semiparametric theory.</li> </ul>
11	<ul style="list-style-type: none"> <li>• Causal inference I: potential outcomes; estimands (ATE/ATT/CATE).</li> <li>• Randomized experiments; regression adjustment; precision gains.</li> </ul>
12	<ul style="list-style-type: none"> <li>• Causal inference II: observational studies; unconfoundedness and overlap.</li> <li>• Propensity-score methods: matching, stratification, weighting.</li> </ul>

Wk	Contents
13	<ul style="list-style-type: none"> <li>• Causal inference III: IPW instability; AIPW/DR estimators.</li> <li>• Influence-function intuition; cross-fitting / DML-style inference.</li> </ul>
14	<ul style="list-style-type: none"> <li>• Causal inference IV: outcome modeling vs. weighting; the targeting principle and an introduction to TMLE-style ideas.</li> <li>• Brief overview of modern learners.</li> </ul>
15	<ul style="list-style-type: none"> <li>• Causal inference V: beyond unconfoundedness—instrumental variables (LATE, 2SLS) and difference-in-differences (DiD).</li> <li>• Sensitivity analysis for hidden confounding (overview).</li> </ul>
16	<ul style="list-style-type: none"> <li>• Course wrap-up and final presentations.</li> </ul>

**Note on the tentative schedule:** The schedule is *flexible* and may be adjusted as the course progresses. We will occasionally include *open, high-level discussions* on loosely related statistical ideas—with an open mind and a free exchange of perspectives—to strengthen intuition and cultivate statistical thinking. In addition, we will discuss *selected recent papers* throughout the semester to connect classical theory to modern methodology and current research practice.
